

# Burn Transfer Guidelines

## Transfer Indicated When There Is:

- Partial thickness and full-thickness burns of greater than 10% of the BSA in patients less than 10 years or over 50 years of age.
- Partial-thickness and full-thickness burns on greater than 20% of the BSA in other age groups.
- Partial-thickness and full-thickness burns involving the face, eyes, ears, hands, feet, genitalia, and perineum, and those that involve skin overlying major joints.
- Full-thickness burns on greater than 5% of the BSA in any age group.
- Chemical or electrical burns or inhalation injuries
- Patients with preexisting illnesses that could complicate treatment, prolong recovery, or affect mortality.
- Evidence of pulmonary injury or respiratory distress
- Brassy or sooty cough or singed nasal hairs
- Carbon Monoxide > 10%
- *Patients who have sustained other trauma injuries in addition to burns or if fixed wing accommodations are not available at your facility, may be transferred to a level I or II trauma center for stabilization before being transferred to a burn center.*

**Always consult with a Level I or II Trauma Center before transferring directly to a Burn Center**

# Electrical Burn Treatment

**Electrical burns are frequently more serious than they appear on the body surface.**

***Significant volumes of tissue beneath the surface may be injured and result in acute renal failure and other complications.***

- ✓ Monitor blood gases and serum bicarbonate levels.
- ✓ Infuse IV fluids initially at a rate to maintain urinary output of 100ml/hr in adults.
- ✓ Observe the urine color for presence of myoglobin (dark, pink, or red)
  - If myoglobin present consider administering Sodium Bicarbonate or Mannitol to promote diuresis and excretion.
- ✓ Monitor cardiac rate and rhythm
- ✓ Monitor for signs and symptoms of compartment syndrome

# Hypothermia Treatment

- ✓ Gently remove wet clothing.
- ✓ Obtain rectal temperature, BP, pulse, and respirations to identify severity of hypothermia
  - **Mild Hypothermia** – Core temperature > 32 degrees C (90 degrees F)
  - **Severe Hypothermia** – Core temperature <32 degrees C (90 degrees F)
- ✓ Keep patient immobile
- ✓ Administer **WARM** and **HUMIDIFIED** oxygen at 100%
- ✓ Cardiac Monitor
  - **ARRHYTHMIAS ARE COMMON** – observe carefully for rhythm changes.
- ✓ Prevent ventricular fibrillation while rewarming
  - **Avoid:**
    - *Rough handling*
    - *Endotracheal tubes*
    - *IV or IM drugs (can rapidly reach toxic levels when patient is rewarmed)*
- ✓ IV Fluid Administration
  - *Lactated Ringers(preferred) or Normal Saline warmed (37.5 degrees C)*
    - *Give 200-300 ml rapidly then slow to give 1 liter in the first hour.*
    - *Maintain infusion rate to keep urine output at 1-2 ml/Kg/hr*
- ✓ Insert foley catheter for accurate urine output measurement

# Guidelines for Cold Injuries

- ✓ Treat hypothermia first!!! (*SEE NEXT PAGE*)
  - *As the core temperature approaches normal, rapid rewarming of the frostbite can be carried out.*
- ✓ Rapid rewarming by immersion in water 40 degrees C (104 degrees F) for 30-60 minutes.
  - *Thawing is complete when the distal tip of the extremity blanches.*
- ✓ Keep Warm and Dry
- ✓ Transfer to Level I or II Trauma Center

## Helpful Hints

- ❖ **DO NOT** massage or manipulate the tissues
- ❖ Administer pain medications
- ❖ Give adequate hydration by appropriate means
  - Lactated Ringers or Normal Saline to correct fluid deficit
- ❖ *Pad between digits with fluffs or lamb's wool.*
- ✓ Tetanus Prophylaxis IM

## Wound Care

- ✓ **REMOVE ALL** clothing, jewelry, and contact lenses.
- ✓ For chemical burns immediately remove all clothing, dust of powders, and begin irrigating with water for at least 30 minutes.
- ✓ **Dress burns loosely with clean dry sterile dressings**  
*(DO NOT APPLY CREAMS OR TOPICAL SOLUTIONS PRIOR TO TRANSFER)*
- ✓ **KEEP** patient **WARM** 
- ✓ If time permits and does not delay transfer, cleanse wounds with saline and antiseptic such as chlorhexidine gluconate or mild soap.

### Other Things to Consider

- Insert foley catheter
- IV pain medications **(BE GENEROUS!!!)**
- Cardiac Monitor
- Tetanus Prophylaxis
- Nasogastric tube

# Types of Burns

## First Degree Burn

- Characterized by erythema, pain, and absence of blisters.

## Second Degree Burn

- Characterized by a red or mottled appearance with swelling and blister formation. The surface may have a wet or weeping appearance and is painfully hypersensitive.

## Third Degree Burn or Full Thickness Burn

- Usually appear dark and leathery. Skin may also appear translucent, mottled, or waxy white. The surface is painless, generally dry, and may appear red and does not blanch with pressure.

# Burn Injury Management

**Burns are No different than any other trauma injury.....ABC's are TOP Priority!!!!**

## Airway

- ✓ Inspect face, nose, and mouth for soot, singed hair, or tissue injury (*if present intubate*)
- ✓ Assess for hoarseness, dry cough, stridor, or respiratory distress (*if present intubate*)
- ✓ Assess for circumferential injury to the neck (*if present intubate*)

## Breathing

- ✓ Administer 100% Oxygen at 15L via non-rebreather or ETT

## Circulation

- ✓ Assess pulses and capillary refill to affected extremities
- ✓ Insert peripheral IV (*it is okay to insert into burned tissue if nothing else is available*)
  - May need to consider Intraosseous/Central Line
- ✓ Prevent hypothermia

**TRANSFER ARRANGEMENTS  
SHOULD BE INITIATED!!!!**

# BURNS

The initial trauma resuscitation of burns can help to minimize the morbidity and mortality caused by the burn injury.

## Priorities

- ❖ AIRWAY
- ❖ BREATHING
- ❖ CIRCULATION
- ❖ WOUND CARE
- ❖ TRANSFER
